

# Bayesian Statistics and Bayesian Cognitive Modeling

Lei Zhang

Institute of Systems Neuroscience, University Medical Center Hamburg-Eppendorf

Special thanks to Antonius Wiehler!

# Schedule

DAY1	9:00 – 17:00	Introduction R Basics Probability Basics Bayes' theorem MCMC and Stan Single Parameter Model – Binomial Model
DAY2	9:00 – 17:00	Multiple Parameter Model – Linear Regression Inference, Predictive Check Reinforcement Learning Model Hierarchical Models Optimizing Stan Codes Model Comparison
DAY3	9:00 – 13:00	Stan Style Tip and Debugging Model-Based fMRI Capstone Project: Delay Discounting Task

# DAY1

09:00 – 09:30	Overview
09:30 – 10:00	R Basics
10:00 – 10:30	Probability basics
<b>10:30 – 10:45</b>	<b>Coffee break</b>
10:45 – 11:30	Bayes' theorem
11:30 – 12:30	Calculation examples
<b>12:30 – 13:30</b>	<b>Lunch break</b>
13:30 – 14:00	Linking data and parameter
14:00 – 15:00	Binomial model
<b>15:00 – 15:15</b>	<b>Coffee Break</b>
15:15 – 16:15	MCMC and Stan
16:15 – 17:00	Binomial model in Stan

# Overview

What is your experience with...

- Statistics?
- R?
- Cognitive Modeling?

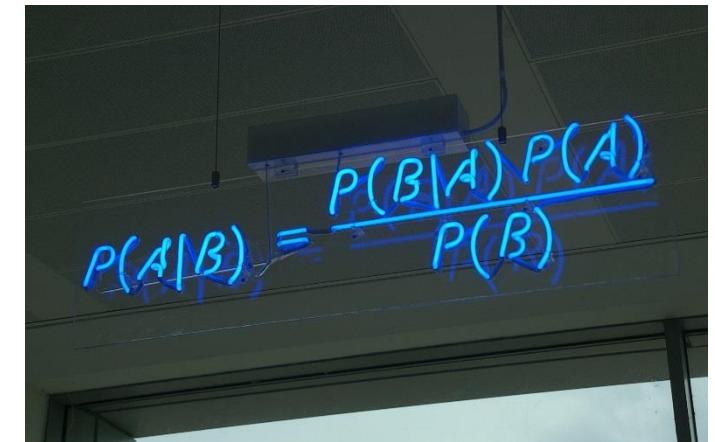

You would like to...

- gain knowledge of Bayesian stats?
- be able to read “computational modeling” section in papers?
- write your own model?

# Overview

This workshop is **NOT** about...

- ... Bayes in the brain
- ... Cognitive process that are Bayesian themselves
- ... Bayesian statistics to supersede classical statistics

$$P(A|B) = \frac{P(B|A) P(A)}{P(B)}$$

However, Bayesian statistics offer great tools to analyze cognitive processes!

- Construct cognitive models
- Estimate posterior distributions of parameters
- Compare models: which is the best one, given the data?

# How to Get the **Most** out of the Workshop

- Ask questions
- Try the exercises
- Talk to each other & help each other

# BASICS OF R PROGRAMMING

# R Basics

cognitive model  
statistics  
computing

- R
  - a programming language for statistical computing
  - R has its own user interface
- R Studio
  - integrated development environment (**IDE**) for R
  - a more sophisticated R-friendly editor, with helpful syntax highlight

script editor

```

# Brief Intro to ggplot2

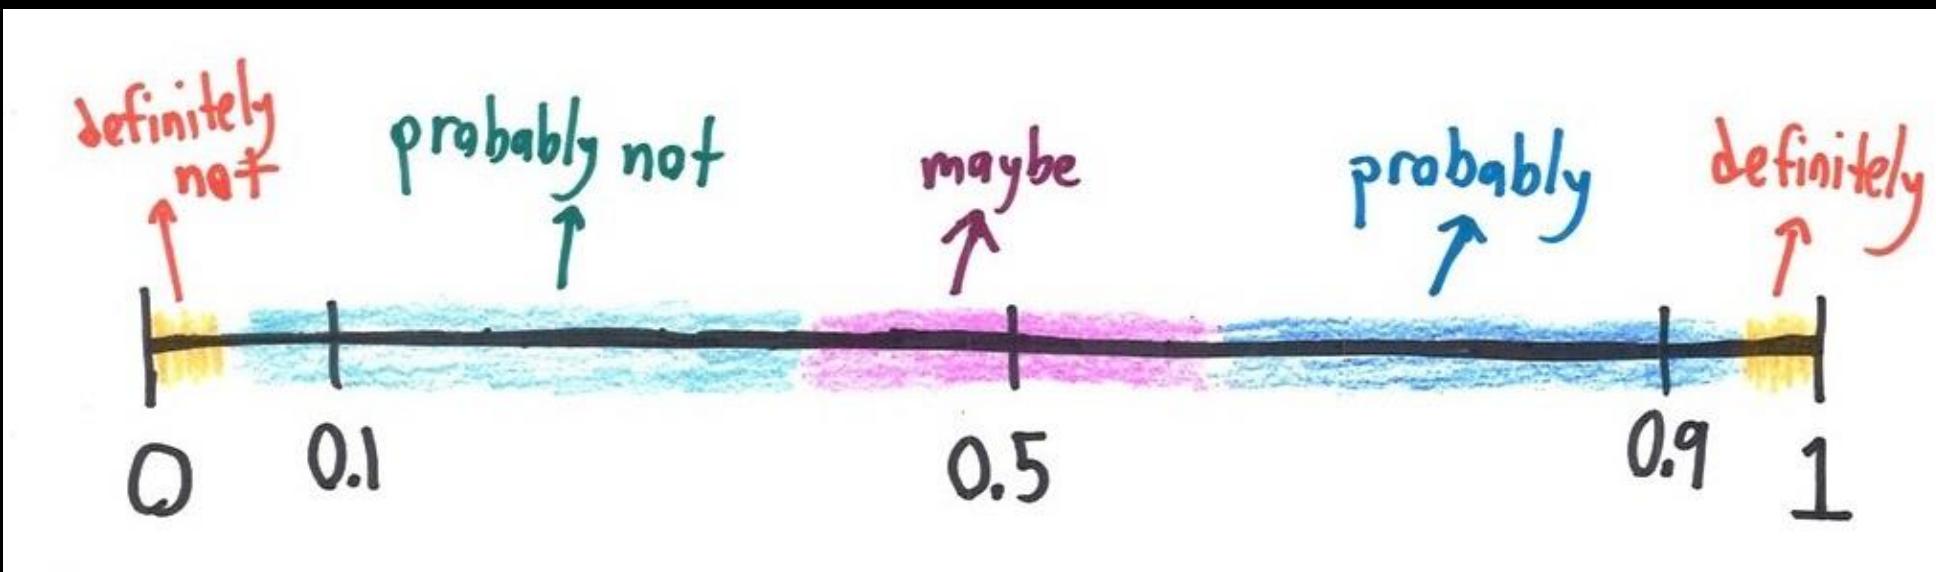

cognitive model  
statistics  
computing

`plot = geometric (points, lines, bars) + aesthetic (color, shape, size)`

game of adding layers!

# BASICS OF PROBABILITY

# Probability

cognitive model  
statistics  
computing

...assigning numbers to a set of possibilities

Properties (Kolmogorov, 1956)

- $p \in [0,1]$
- $\sum p = 1$
- $p(A \cup B) = p(A) + p(B)$ , when A and B are *mutually exclusive*

# Joint Probability and Conditional Probability

cognitive model  
statistics  
computing

## Joint Probability

$$p(A, B) = p(B, A)$$

- e.g.,  $p(\text{raining})$  and  $p(\text{cold})$

## Conditional Probability

$$p(A|B) - \text{'p of A given B'}$$

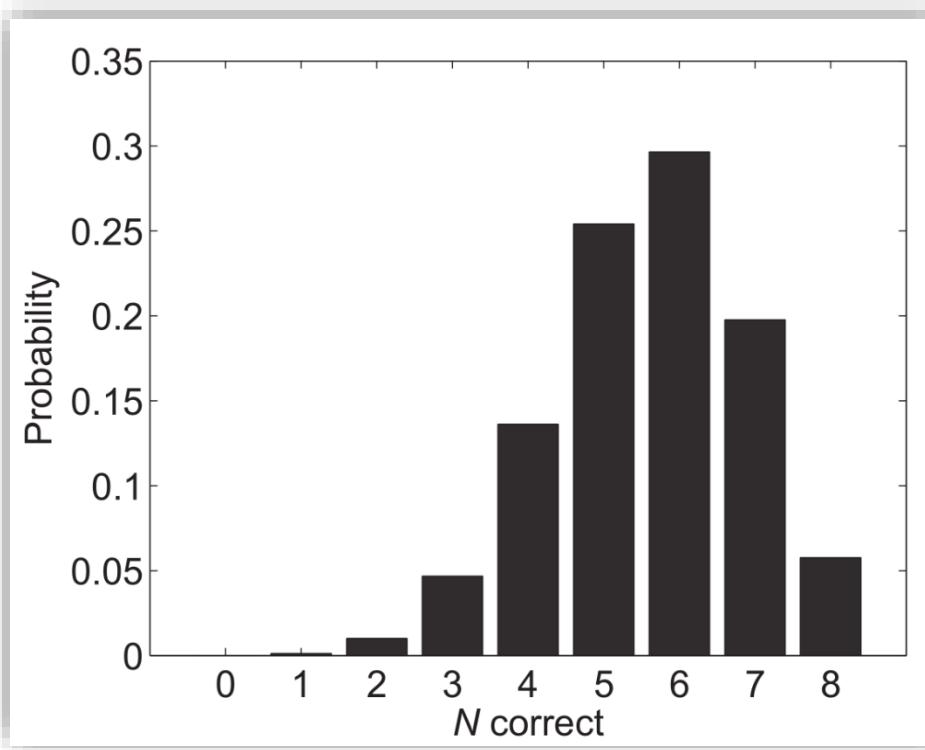

$$p(A,B) = p(A|B)p(B), \text{ when A and B are independent}$$

- e.g.,  $p(\text{raining}, \text{cold}) = p(\text{raining}|\text{cold})p(\text{cold})$

# Probability Functions

cognitive model  
statistics  
computing

discrete events

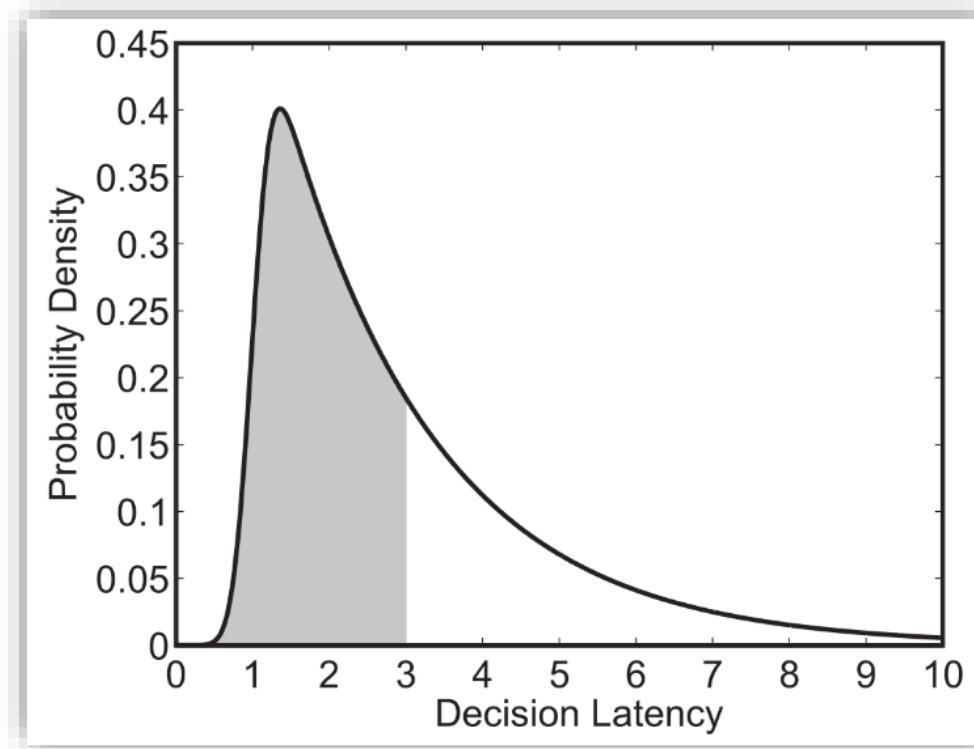

# Probability Functions

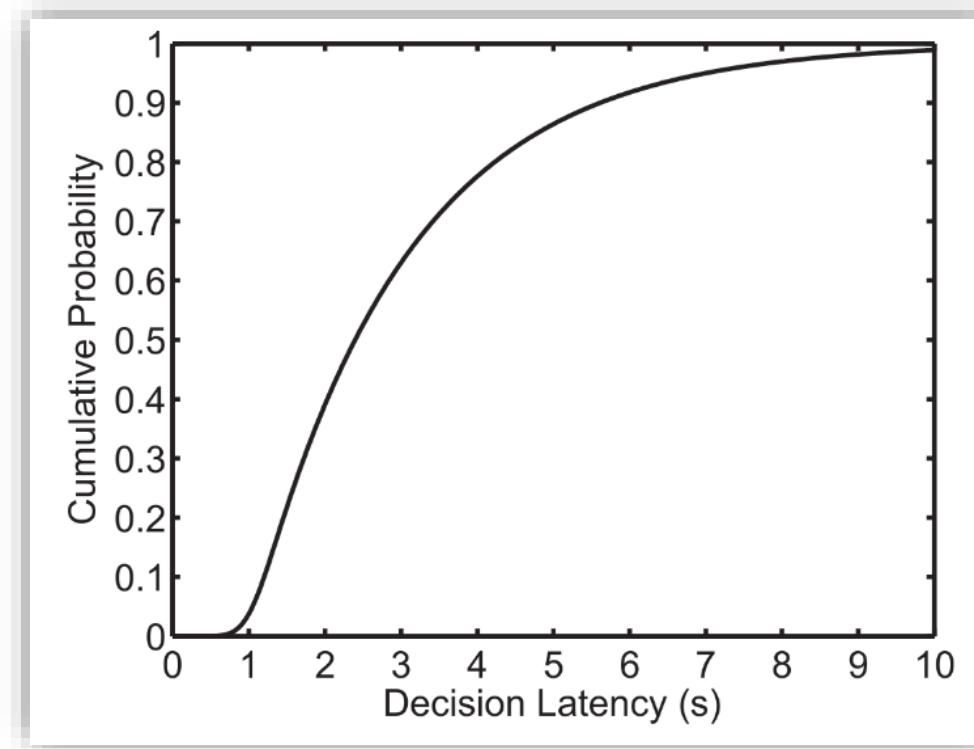

cognitive model  
statistics  
computing

## continuous events

probability density function (PDF)

cumulative distribution function (CDF)

# Playing with Probability Functions in R

cognitive model  
statistics  
computing

`dnorm()` – PDF

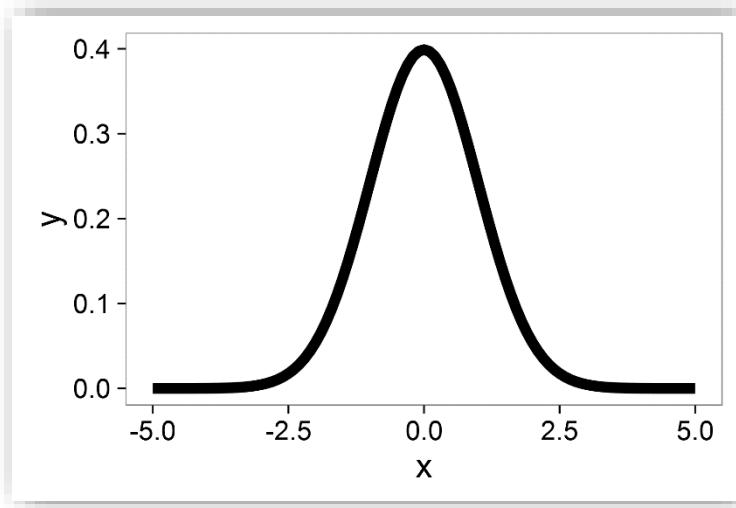

`pnorm()` – CDF

`qnorm()` – quantile, inverse cdf

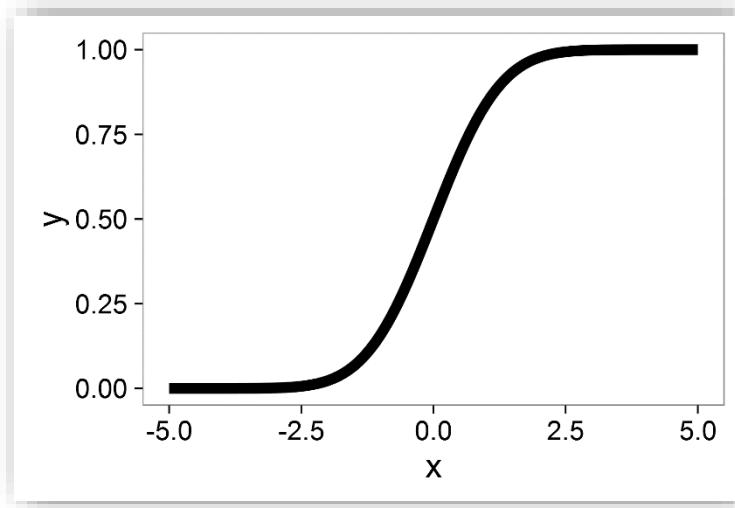

`rnorm()` – random number generator

# Example: Normal(0,1)

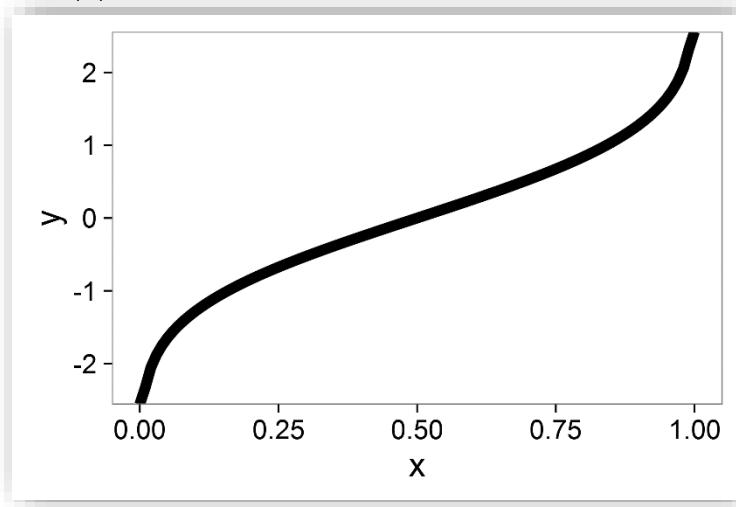

`dnorm()`

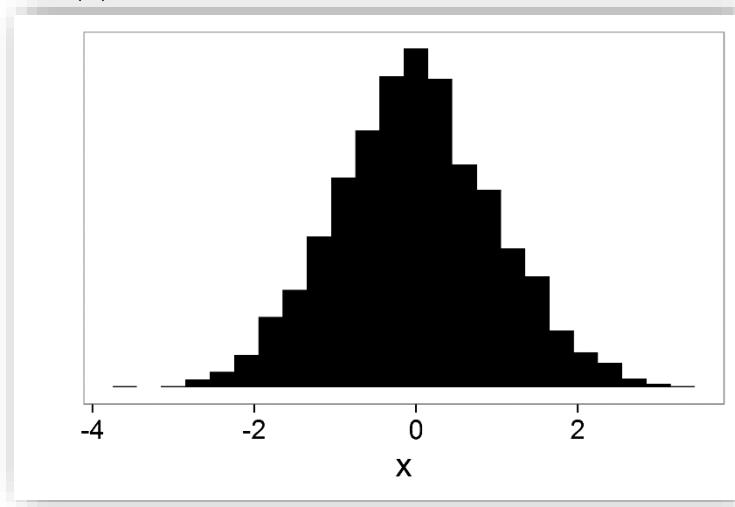

`pnorm()`

`qnorm()`

`rnorm()`

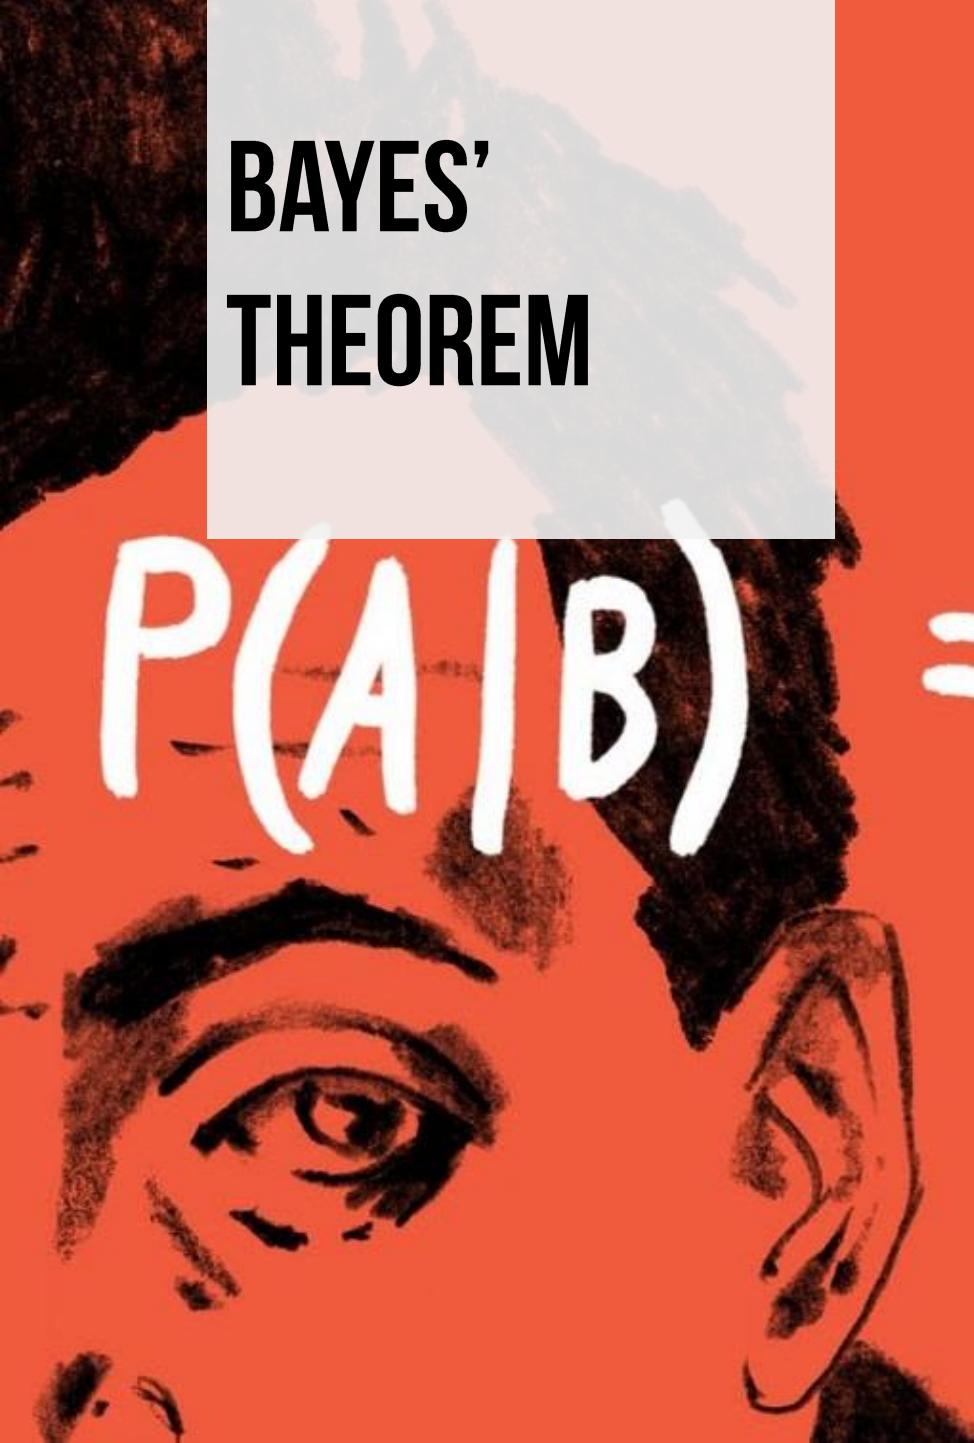

# Exercise III

cognitive model  
statistics  
computing

.../BayesCog/01.R\_basics/\_scripts/R\_basics.R

TASK: produce `dnorm`, `pnorm`, `qnorm`, `rnorm` figures for  
 $\text{Normal}(0.5, 2)$

# BAYES' THEOREM

$P(A|B)$

$$= \frac{P(B|A)P(A)}{P(B)}$$

# Bayes' theorem

$$p(A,B) = p(B,A)$$

$$p(A,B) = p(A|B)p(B)$$

$$p(B,A) = p(B|A)p(A)$$

$$p(A|B)p(B) = p(B|A)p(A)$$

$$p(A | B) = \frac{p(B | A)p(A)}{p(B)}$$

$$p(A | B) = \frac{p(B | A)p(A)}{\sum_{A^*} p(B | A^*)p(A^*)}$$

$A^*$  is a variable that takes on all possible values

# One Example

		Column		Marginal	
Row		...	<b>c</b>	...	
:			:		
<i>r</i>	...	$p(r, c) = p(r c) p(c)$		...	$p(r) = \sum_{c^*} p(r c^*) p(c^*)$
:			:		
Marginal		$p(c)$			

# One Example

cognitive model  
statistics  
computing

		Hair color				Marginal (Eye color)
Eye color		Black	Brunette	Red	Blond	
		0.11	0.20	0.04	0.01	0.37
<b>Brown</b>		0.03	0.14	0.03	0.16	0.36
<b>Blue</b>		0.03	0.09	0.02	0.02	0.16
<b>Hazel</b>		0.01	0.05	0.02	0.03	0.11
<b>Green</b>						
<b>Marginal (hair color)</b>		0.18	0.48	0.12	0.21	1.0

		Hair color				Marginal (Eye color)
Eye color	Black	Brunette	Red	Blond		
		0.03/0.36 = 0.08	0.14/0.36 = 0.39	0.03/0.36 = 0.08	0.16/0.36 = 0.45	0.36/0.36 = 1.0
<b>Blue</b>						

# Exercise IV

cognitive model  
statistics  
computing

Suppose that in the general population, the probability of having a rare disease is 1/1000. We denote the true presence or absence of the disease as the value of a parameter,  $\vartheta$ , that can have the value  $\vartheta = \text{😊}$  if disease is present in a person, or the value  $\vartheta = \text{☺}$  if the disease is absent. The base rate of the disease is therefore denoted  $p(\vartheta = \text{😊}) = 0.001$ .

Suppose(1): a test for the disease that has a 99% hit rate:  $p(T = + | \vartheta = \text{😊}) = 0.99$

Suppose(2): the test has a false alarm rate of 5%:  $p(T = + | \vartheta = \text{☺}) = 0.05$

Q: Suppose we sample a person at random from the population, administer the test, and it comes up positive. What is the posterior probability that the person has the disease?

# Exercise IV

cognitive model  
statistics  
computing

Q: What is the posterior probability that the person has the disease?

$$\rightarrow p(\vartheta = \text{患病} | T = +)$$

# Exercise IV

cognitive model  
statistics  
computing

Test result	Disease		Marginal (test result)
	$\theta = \ddot{\circ}$ (present)	$\theta = \circ$ (absent)	
$T = +$	$p(+ \ddot{\circ}) p(\ddot{\circ})$ $= 0.99 \cdot 0.001$	$p(+ \circ) p(\circ)$ $= 0.05 \cdot (1 - 0.001)$	$\sum_{\theta} p(+ \theta) p(\theta)$
$T = -$	$p(- \ddot{\circ}) p(\ddot{\circ})$ $= (1 - 0.99) \cdot 0.001$	$p(- \circ) p(\circ)$ $= (1 - 0.05) \cdot (1 - 0.001)$	$\sum_{\theta} p(- \theta) p(\theta)$
Marginal (disease)	$p(\ddot{\circ}) = 0.001$	$p(\circ) = 1 - 0.001$	1.0

$$\begin{aligned}
 p(\theta = \ddot{\circ} | T = +) &= \frac{p(T = + | \theta = \ddot{\circ}) p(\theta = \ddot{\circ})}{\sum_{\theta} p(T = + | \theta) p(\theta)} \\
 &= \frac{0.99 \cdot 0.001}{0.99 \cdot 0.001 + 0.05 \cdot (1 - 0.001)} \\
 &= 0.019
 \end{aligned}$$

# LINKING DATA AND PARAMETER

$p(\theta | D)$

$p(D | \theta)$

$p(\theta)$

$p(D)$

# Linking Data and Parameter

cognitive model  
statistics  
computing

$$p(A|B) = \frac{p(B|A)p(A)}{p(B)}$$

A diagram illustrating the components of the Bayes' rule formula. On the left, there is a term  $p(A|B)$ . Two blue arrows point towards it: one from the symbol  $\theta$  above and another from the symbol  $D$  to its right.

# Linking Data and Parameter

cognitive model  
statistics  
computing

$$p(\theta|D) = \frac{p(D|\theta)p(\theta)}{p(D)}$$

# Linking Data and Parameter

cognitive model  
statistics  
computing

## Likelihood

How plausible is the data given our parameter is true?

## Prior

How plausible is our parameter before observing the data?

$$p(\theta|D) = \frac{p(D|\theta)p(\theta)}{p(D)}$$

## Posterior

How plausible is our parameter given the observed data?

## Evidence

How plausible is the data under all possible parameters?

# What is $p(\text{Data})$ ?

cognitive model  
statistics  
computing

discrete parameters

$$p(\theta | D) = \frac{p(D | \theta)p(\theta)}{\sum_{\theta^*} p(D | \theta^*)p(\theta^*)}$$

continuous parameters

$$p(\theta | D) = \frac{p(D | \theta)p(\theta)}{\int p(D | \theta^*)p(\theta^*)d\theta^*}$$

# **BINOMIAL MODEL**

# Binomial Model

cognitive model  
statistics  
computing

- You are curious how much of the surface is covered in water.
- You will toss the globe up in the air.
- You will record whether or not the surface under your right index finger is water (W) or land (L).
- You might observe: W L W W W L W L W → 6/9
- What to do next?

cognitive model
statistics
computing

# Steps of Bayesian Modeling?

A data story

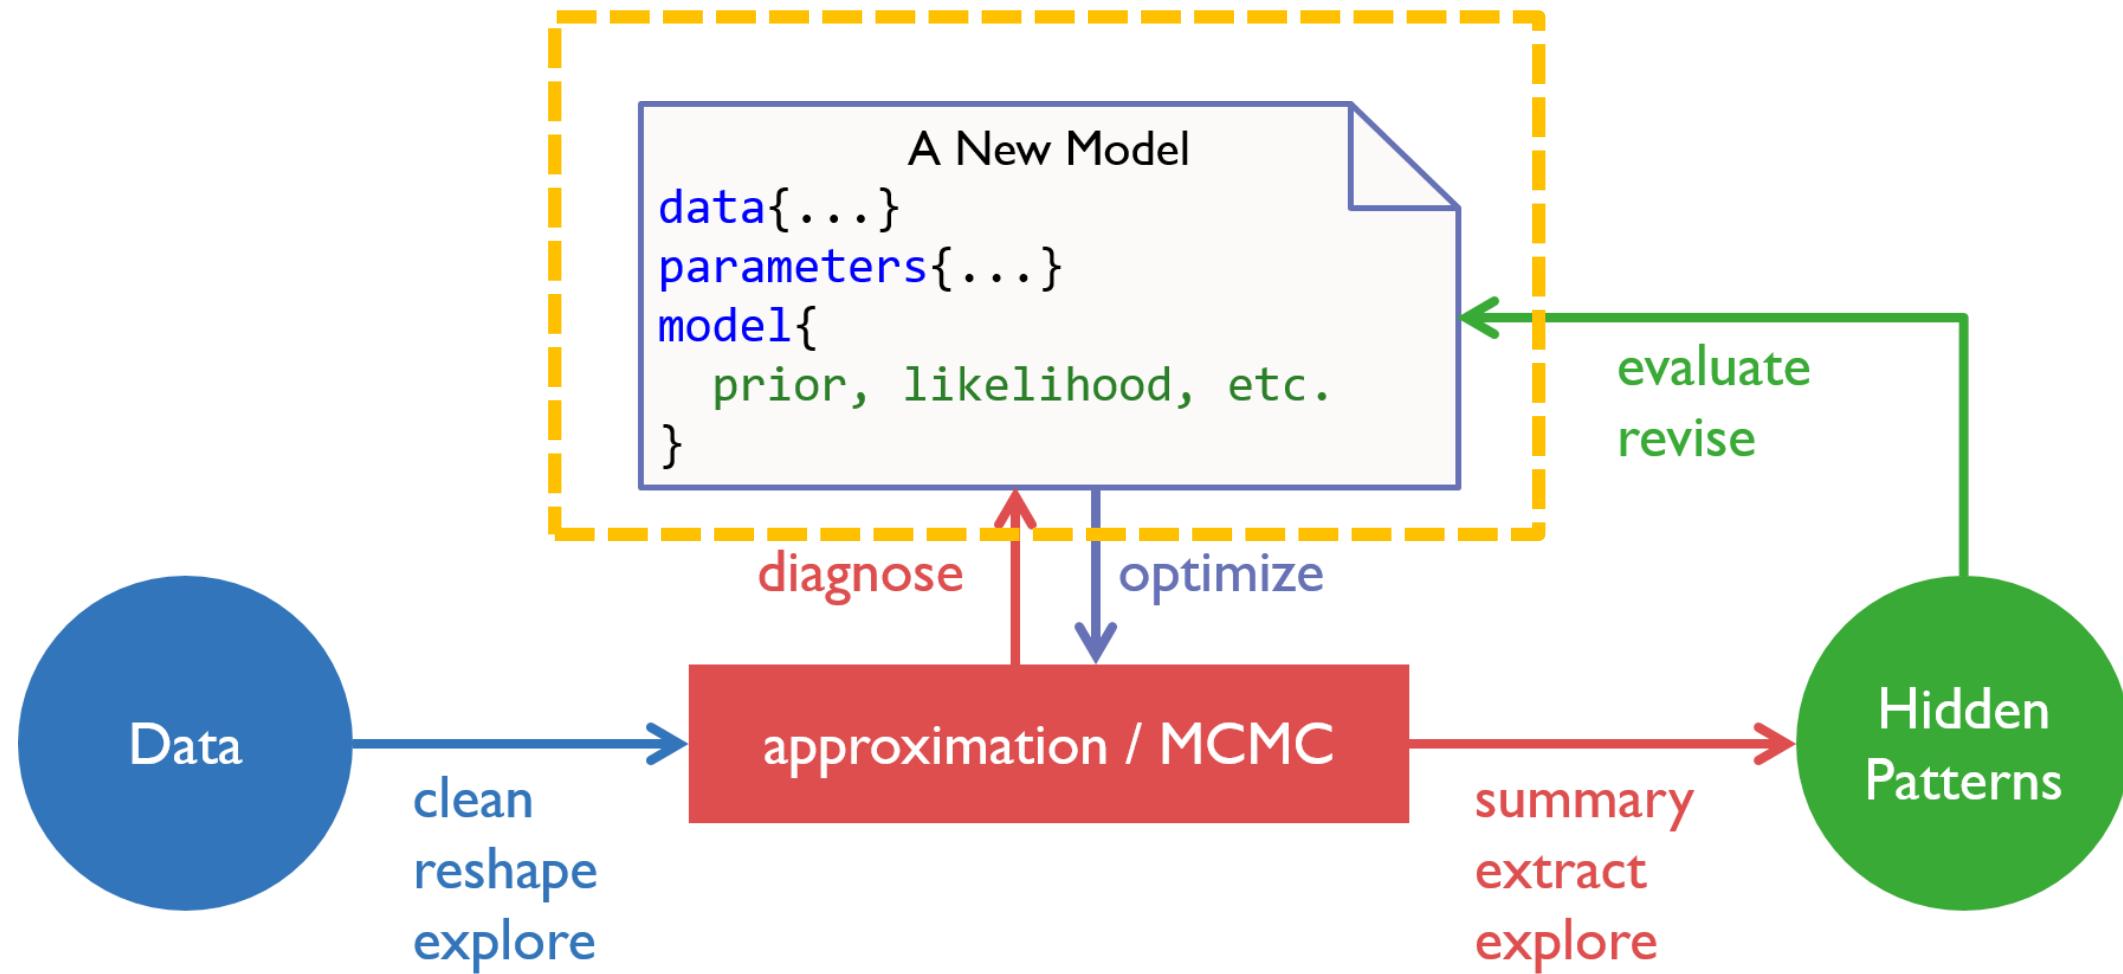

Think about how the data might arise.  
It can be *descriptive* or even *causal*.

Update

Educate your model by feeding it the data.  
**Bayesian Update:**  
update the prior, in light of data, to produce posterior.

Evaluate

Compare model with reality.  
Revise your model.

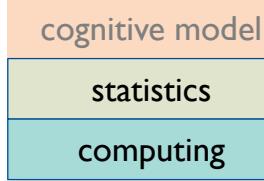

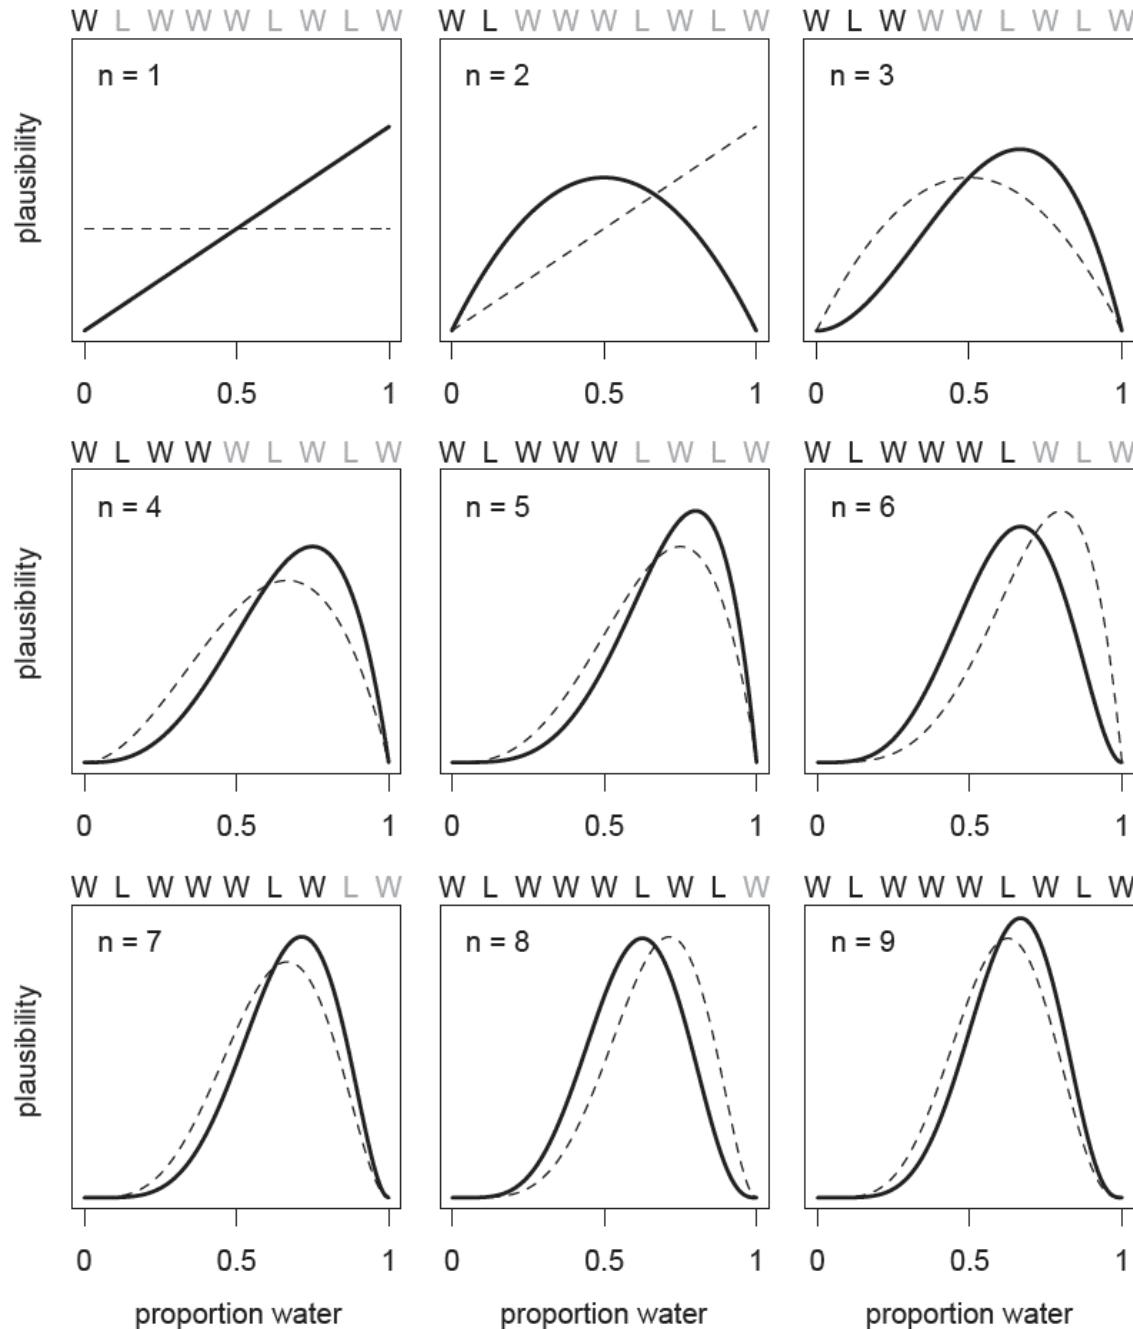

# A Data Story of the Globe

- The true proportion of water covering the globe is  $p$ .
- A single toss of the globe has a probability  $p$  of producing a water (W) observation. It has a probability  $1 - p$  of producing a land (L) observation.
- Each toss of the globe is independent of the others.

# Update

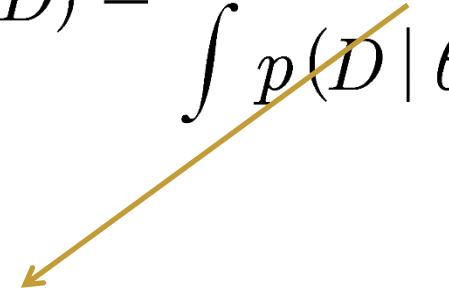

# Components of a Model

cognitive model
statistics
computing

think about the likelihood function:

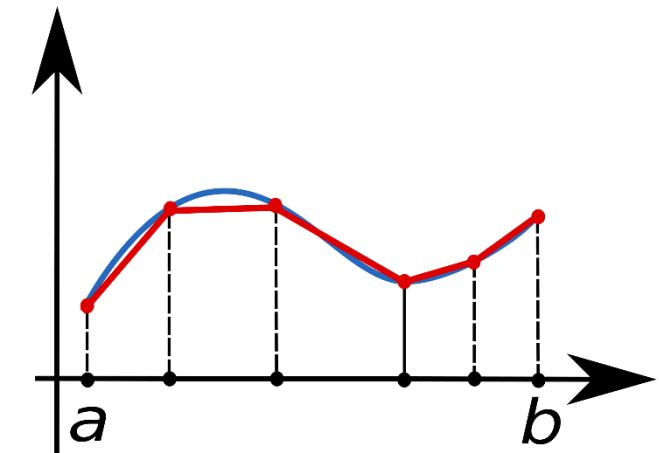

$$p(\theta | D) = \frac{p(D | \theta)p(\theta)}{\int p(D | \theta^*)p(\theta^*)d\theta^*}$$

$$p(w | N, p) = \binom{N}{w} p^w (1-p)^{N-w}$$

# Binomial Model – Grid Approximation

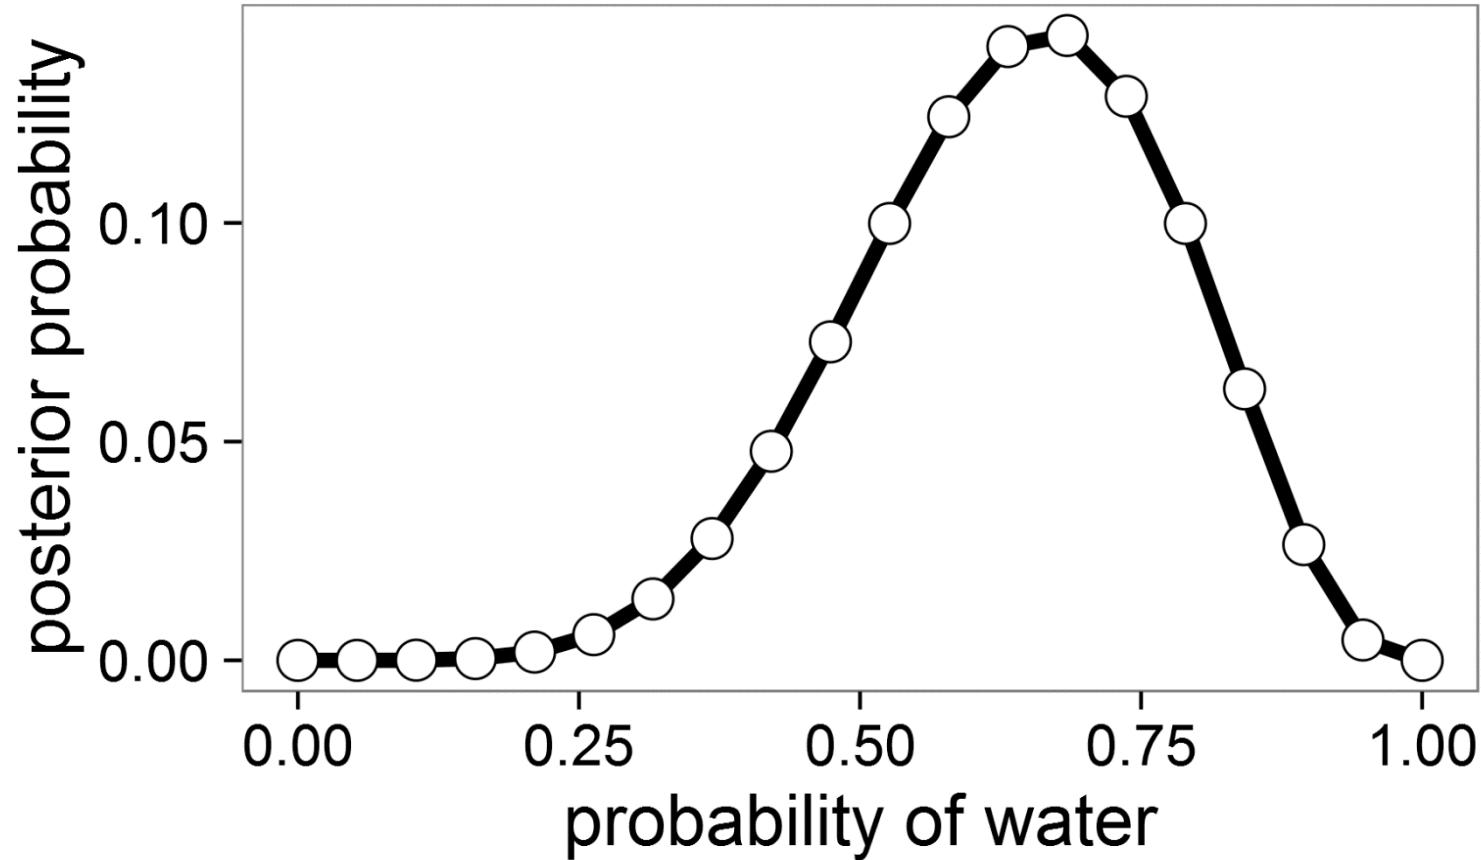

```
p_start <- 0; p_end <- 1; n_grid <- 20  
w <- 6; N <- 9  
  
# define grid  
p_grid <- seq( from = p_start ,  
               to = p_end , length.out = n_grid )  
  
# define prior  
prior <- rep(1 , n_grid)  
  
# compute likelihood at each value in grid  
likelihood <- dbinom(w , size = N , prob = p_grid )  
  
# compute product of likelihood and prior  
unstd.posterior <- likelihood * prior  
  
# standardize the posterior, so it sums to 1  
posterior <- unstd.posterior / sum(unstd.posterior)
```

# Binomial Model – Grid Approximation

computing

# Visual Example

cognitive model  
statistics  
**computing**

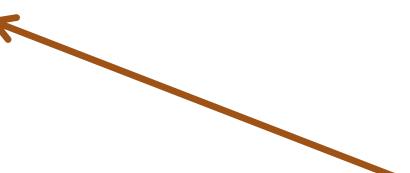

# MCMC Sampling Algorithms

cognitive model  
statistics  
computing

- Rejection sampling
- Importance sampling
- Metropolis algorithm
- Gibbs sampling → JAGS
- HMC sampling

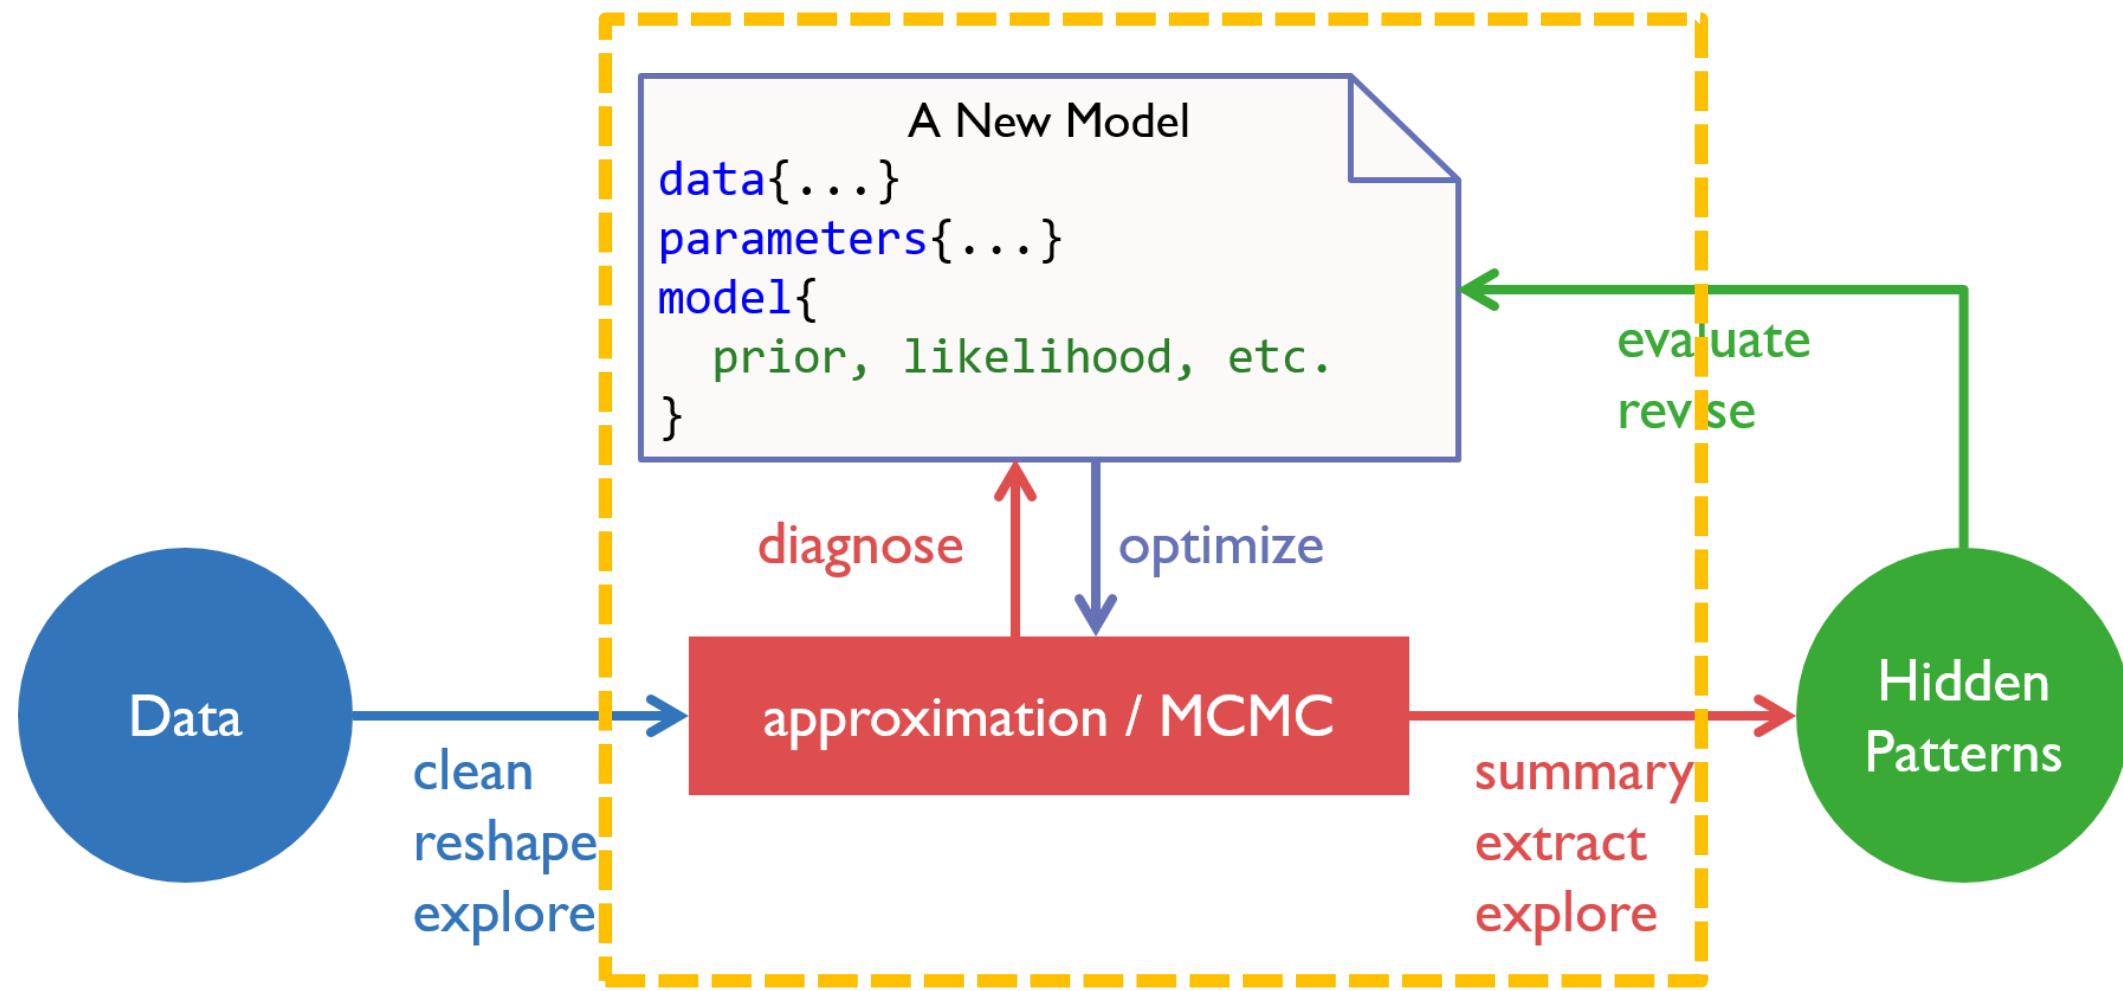

Stan!

# **STAN PROGRAMMING LANGUAGE**

# Why Use Stan?

cognitive model  
statistics  
computing

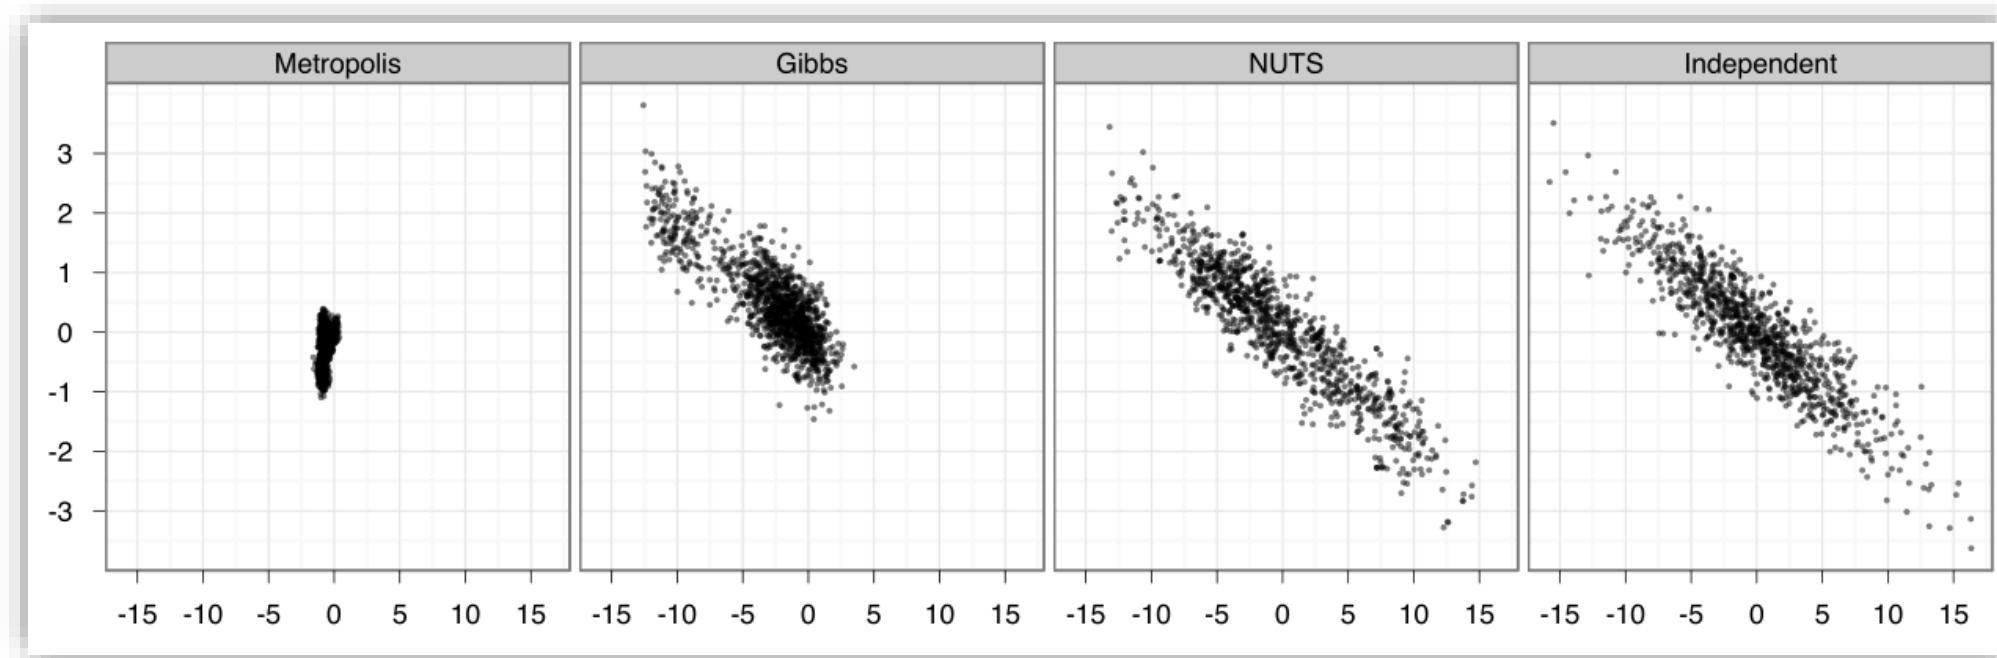

## vs. BUGS and JAGS

- Time to converge and per effective sample size:  
0.5 -  $\infty$  times faster
- Memory usage: 1 - 10%
- Language features
  - variable overwrite: `a = 4, then a = 5`
  - formal if-else
  - full support of vectorizing

# NUTS vs. Gibbs and Metropolis

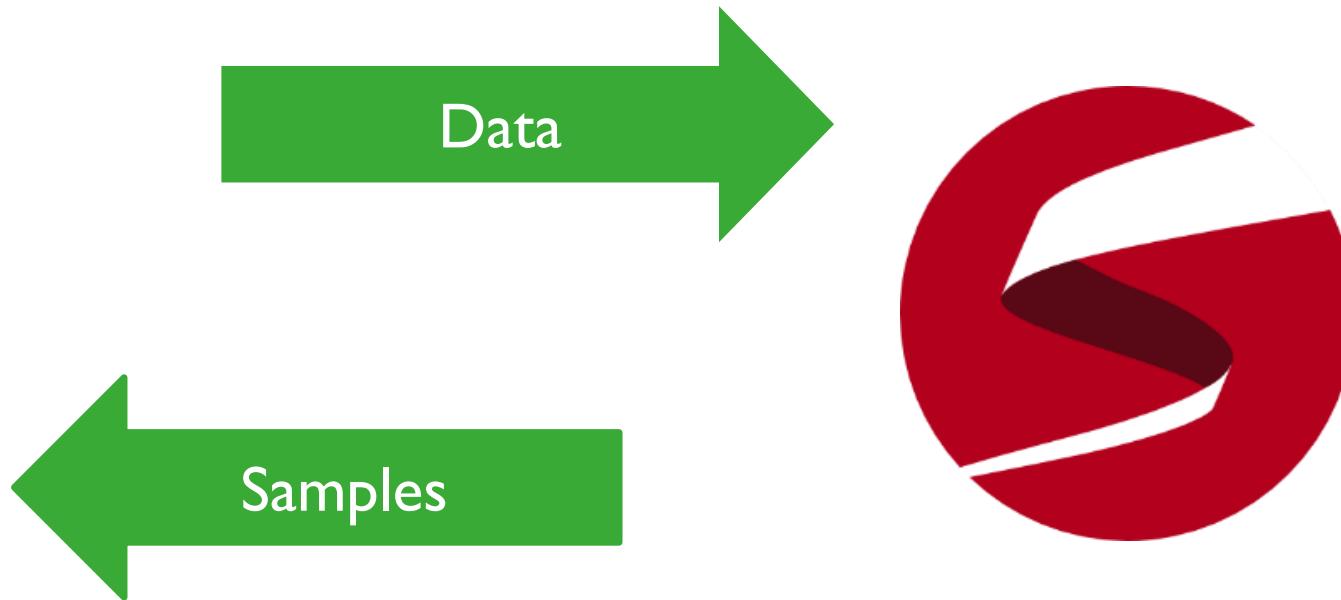

cognitive model  
statistics  
computing

Hamilton MC (HMC) implements No-U-Turn Sampler (NUTS)

- Two dimensions of highly correlated 250-dim normal
- 1,000,000 draws from Metropolis and Gibbs (thin to 1000)
- 1,000 draws from NUTS; 1000 independent draws

# Stan and RStan

# Steps of Bayesian Modeling, with Stan

## A data story

Think about how the data might arise.  
It can be *descriptive* or even *causal*.  
**Write a Stan program.**

## Update

Educate your model by feeding it the data.  
Bayesian Update:  
    update the prior, in light of data, to produce posterior.  
**Run Stan using RStan (PyStan, MatlabStan etc.)**

## Evaluate

Compare model with reality.  
Revise your model.  
**Evaluate in RStan and ShinyStan.**

# Steps of Using Stan

cognitive model  
statistics  
computing

1. Stan program read into memory
2. Source-to-source transformation into C++
3. C++ compiled and linked (takes a while)
4. Run Stan program
5. Posterior analysis (Stan interface)

```
data {  
    int<lower=0> N;  
    int<lower=0,upper=1> y[N];  
}  
parameters {  
    real<lower=0,upper=1> theta;  
}  
model {  
    y ~ bernoulli(theta);  
}
```

```
/* Stan provides its own version of

```

# Stan Language

## model blocks

```
data {  
    //... read in external data...  
}  
  
transformed data {  
    //... pre-processing of data ...  
}  
  
parameters {  
    //... parameters to be sampled by HMC ...  
}  
  
transformed parameters {  
    //... pre-processing of parameters ...  
}  
  
model {  
    //... statistical/cognitive model ...  
}  
  
generated quantities {  
    //... post-processing of the model ...  
}
```

cognitive model  
statistics  
computing

# General Properties of Stan Language

cognitive model  
statistics  
computing

- Whitespace does not matter
- Comments
  - // or #
  - /\* ... \*/
- Must use semicolon ( ; )
- Variables are typed and scoped

# Variable Declaration

cognitive model  
statistics  
computing

- Each variable has a type (static type)
- Only values of that type can be assigned to the variable
- Declaration of variables happen at the top of a block (including local blocks)

# Scalar Variables

cognitive model  
statistics  
computing

real

- scalar
- continuous

```
data {  
    real y;  
}
```

int

- scalar
- integer
- can't be used in **parameters** or **transformed parameters** blocks

```
data {  
    int n;  
}
```

# Constraining Scalar Variables

cognitive model  
statistics  
computing

```
data {  
    int<lower=1> m;  
    int<lower=0,upper=1> n;  
    real<lower=0> x;

computing

W L W W W L W L W

$$p(w | N, p) = \binom{N}{w} p^w (1 - p)^{N-w}$$

$$w \sim \text{Binomial}(N, p)$$

reads as:  $w$  is distributed as a binomial distribution, with number of trials  $N$ , and success rate  $p$ .

# Model Summary

cognitive model  
statistics  
computing

```
> print(fit_globe)
Inference for Stan model: binomial_globe_model.
4 chains, each with iter=2000; warmup=1000; thin=1;
post-warmup draws per chain=1000, total post-warmup draws=4000.
```

	mean	se_mean	sd	2.5%	25%	50%	75%	97.5%	n_eff	Rhat
p	0.64	0.00	0.14	0.34	0.54	0.65	0.74	0.87	2774	1
lp__	-7.73	0.02	0.78	-9.90	-7.89	-7.43	-7.26	-7.21	1242	1

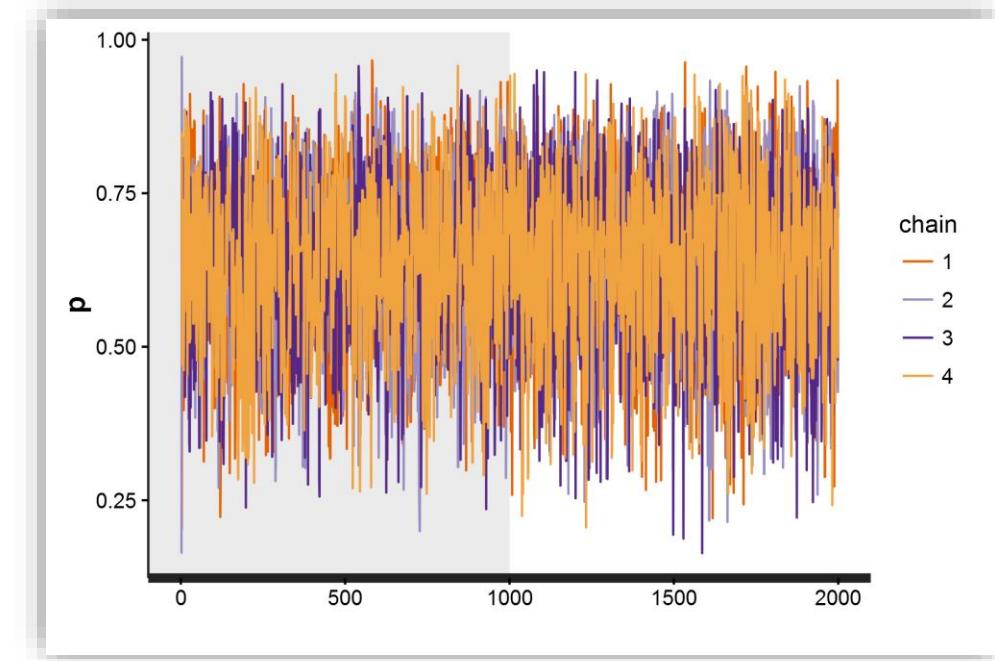

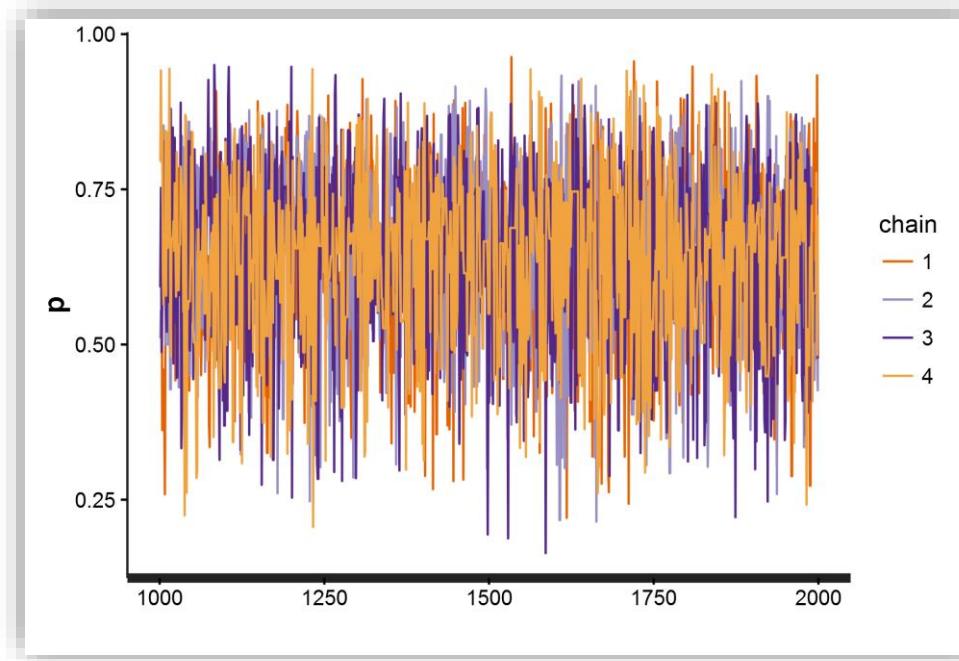

Samples were drawn using NUTS(diag\_e) at Tue Sep 06 18:23:15 2016.  
For each parameter, n\_eff is a crude measure of effective sample size,  
and Rhat is the potential scale reduction factor on split chains (at  
convergence, Rhat=1).

# Draw a Conclusion?

cognitive model  
statistics  
computing

- 6W / 9 trials
- uncertainty (relative plausibility) of all  $p$  values
- the relative plausibility of  $p = 0.63$  is the highest, but it never rules out the possibility of  $p$  being other values, e.g., 0.5, 0.75  
→ when  $p = 0.5$ , you may still observe 6W / 9 trials

# Is Anything Missing? – NO
